1 INTRODUCTION

1.1 Purpose

The purpose of this report is to identify the latest techniques in national and international best practice for minimising waste disposals (Schedule 11 - Item 2) and to compare this with current and planned strategies at Dounreay to determine whether the waste management practices at Dounreay continue to represent BPEO (Schedule 11 - Item 1).

1.2 Waste Minimisation

To provide a clear basis for the study it is important to clarify what is encompassed by waste minimisation. In its simplest form, this requires avoidance of waste in the first instance and reducing as far as possible the volume requiring disposal once the waste has been produced.

The Waste Management Licensing (Scotland) Regulations 2011 [1] set out in paragraph 6(2) of Schedule 4, the requirement to apply the waste hierarchy as a relevant objective. It states that the waste hierarchy is to be applied in such a manner as to deliver the best overall environmental outcome. Thus, the following figure represents the waste hierarchy and is adopted at Dounreay; it is preferred to manage wastes in order from the top to the bottom with the option at the bottom being the least favoured. It should be noted that paragraph 6(3) of Schedule 4 also allows for departure from the waste hierarchy for particular wastes types where it can be justified, in order to deliver the best overall environmental outcome

skill sets and experience from other nuclear and commercial organisations. Thus, the BDP Dounreay PBO Competition document [12] has been reviewed to identify proposed technical changes to waste management and the output has also been included within this document.

2 ASSUMPTIONS AND CONSTRAINTS

The following assumptions and constraints have been made in relation to the BPEO:

- **Options must be consistent with UK Government policy on waste management**

  Although the SEPA/EA guidance states that there is no requirement to include consistency with Government policy explicitly in a BPEO study, it is important in determining how the UK meets international commitments and sets regulation on radioactive waste management. Further, the Management of Radioactive Waste is devolved to the Scottish Government. It is therefore considered that to progress the DSRL Life Time Plan, waste management options must be consistent with Scottish Government policy. Any deviation from this would require discussion with Scottish Government and would require their agreement prior to implementation.

- **Options must be consistent with regulatory requirements**

  Options must be capable of being legally implemented and therefore must not include any practices that are prohibited or do not meet legal requirements.

- **Options must comply with international conventions**

  The option must not cause a breach of duty of care to the environment outside national boundaries, breach international agreements / treaties or breach non-UK law.

- **Options must be technically feasible using existing or reasonably foreseen methods and processes and enable the achievement of the DSRL site interim end state**

  Waste management options need to exist and be able to be implemented over a reasonable timescale in line with the site programme and scheduled interim end state.

3 REVIEW OF BEST PRACTICE TECHNIQUES

Best practice techniques in waste minimisation that are either new or have been revised since 2009 are listed in Table 1 below; the full list of available techniques is presented in Appendix 1. This information was obtained from:

- The Environment Agencies Requirements Working Group (EARWG) waste minimisation best practice database. This is a live database that contains information on abatement technologies, which is the result of an ongoing review of national and international best practice and emerging technologies. The EARWG is comprised of a number of nuclear industry representatives[1]. The EARWG was formed to provide an industry approach to addressing the generic Additional Information and Improvement Requirements (AIIRs)

[1] AWE plc, Babcock International Group plc (Marine Division), BAe Systems Marine, British Energy, GE Healthcare, LLW Repository Ltd, Magnox North Ltd, Magnox South Ltd, Ministry of Defence, Rolls-Royce Marine Power Operations Ltd, Research Sites Restoration Ltd, Sellafield Ltd, Springfields Fuel Ltd, Studsvik UK Ltd and URENCO UK Ltd.

contained in the Permits and Authorisations granted to individual members by the EA and SEPA respectively.

- US-DOE Waste Management literature and databases.
- UK nuclear site Integrated Waste Strategy (including TBuRD) and Lifetime Plan documents.
- NDA RWMD website and literature
- The BDP Dounreay PBO Competition Document

Table 1 - New or Revised Techniques

Method	Technique	Date *	Utilised	Justification
Dismantling	Abrasive Water Jet Cutting	22/04/2012	No	DSRL processes are well established, utilising dry techniques (e.g. mechanical cutting and Diamond Wire Cutting) to minimise the potential for gaseous and /or liquid radioactive releases. Abrasive Water Jet Cutting produces significant radioactive aerosols and radioactive liquids which require significant treatment prior to discharge.
Encapsulation	Geomelt Vitrification	22/04/2012	No	DSRL processes are well established, utilising low complexity cementation. This process has a low potential for gaseous or liquid radioactive releases. Whereas, geomelt vitrification has a high energy consumption and the need for additional mobile (complex) abatement (particulate filtration, quenching, wet scrubbing, two stage HEPA filtration and carbon adsorption or thermal oxidation. Significant secondary waste production. Very slow process as melt is a few centimetres per hour. Requires glass forming constituents.
	Plasma Vitrification	22/04/2012	No	DSRL processes are well established, utilising low complexity cementation. This process has a low potential for gaseous or liquid radioactive releases and low energy needs. Plasma Vitrification is a very high temperature (10,000 Kelvin) process with very high energy consumption and rigorous process control.
Storage	NDA Container	11/05/2011	Yes	NDA RWMD approved range of radioactive waste containers and those currently going through approval.
	Sludge Stabilisation	22/04/2012	Yes	DSRL will have a number of localised LLW sludges being generated at a number of locations across the site at differing times into the future. The volume generated at each location with the exception of the Shaft and Silo is small. Thus, DSRL currently operate smaller scale non complex and low cost cementation plant at each location. There maybe opportunities to re-use these plant at a number of locations where the programme and scheduling are compatible. A bulk plant is currently proposed to manage wastes from the shaft and silo, as the current small scale cementation processes would not be able to support the production requirements for the Shaft and Silo.
Direct Disposal	Direct Disposal to LLW Repository near Drigg	11/05/2011	No	DSRL are not Authorised to dispose of LLW at LLWR. Thus, DSRL are currently building a LLW Repository adjacent to Dounreay for Authorised disposal of LLW.

Method	Technique	Date *	Utilised	Justification
Chemical Separation	Ion Exchange	11/05/2011	Yes	Ion Exchange is employed at DFR, PFR, D1204 and D1251
	Inorganic Media (Ion Exchange)	11/05/2011	Yes	Inorganic media is utilised to clean up the liquid discharge from the sodium/ potassium (NaK) primary coolant destruction plant and Ion Sieve 911 is utilised for pond water treatment at DFR
	Zeotypes (Ion Exchange)	11/05/2011	Yes	DSRL have installed this technique to support effluent treatment (if required) at D1224 (the shaft)
	Hexacyanoferrate (Ion Exchange)	11/05/2011	Yes	DSRL employ this technique at the Ultra Filtration Plant (UPP) for effluent treatment for the Silo.
	Other Materials (Ion Exchange)	11/05/2011	No	Not mature – still under development
	Organic Media (Ion Exchange)	05/11/2011	No	Low radiation stability for long term storage/ disposal
Treatment of Non Aqueous Liquids	Mercury Decontamination	22/04/2012	No	DSRL are going to the market place to determine what options are commercially available for mercury treatment.

* The date represents a new or modified record within the EARWG database, but does not necessarily represent a major change to the technique.

There have been relatively few updates in the past four years, although DSRL currently utilise a few of the techniques mentioned in Table 1. A number of the updated techniques listed above would not be BPM with the DSRL Plan and therefore are not employed.

It should be noted that whilst DSRL does not employ some of the techniques in Table 1, it does apply appropriate alternatives that are already in use on the site and are best practice techniques, elsewhere within the EARWG database.

4 APPLICATION OF NATIONAL AND INTERNATIONAL BEST PRACTICE TECHNIQUES

Each UK nuclear site is required to establish (through their RSA Certificates of Authorisation) how it performs against best practice for the application of the waste minimisation technique. This information, sourced from individual site Integrated Waste Strategy documents and individual sites Technical Baseline and Underpinning Research and Development documents, is summarised in Appendix 2 along with those techniques employed or proposed for use at Dounreay.

The techniques used across the UK nuclear industry are broadly similar (as is the outcome achieved) for comparable waste streams. The current DSRL approach of using a number of different containers, some self-shielded and some not, combined with grouting now or in the future will achieve the same outcome as the other UK nuclear sites in that HAW can be stored for long periods in a manner that does not preclude future disposition to a Geological Disposal Facility (GDF) should the Scottish Government Higher Activity Waste (HAW) Policy [13] change. Whilst paragraph 2.04.30 of the HAW Policy states that disposal as near to surface as practicable is one of a number of options, paragraph 2.04.03 of the same Policy gives a clear indication of Scottish Government's preference for this option. As a result HAW storage is the

Scottish Governments preferred option. The D
with the Scottish Policy and it is recognised
compliance with changes to the HAW policy.

The best practice techniques for waste minim

disposal facility currently under construction adjacent to the Dounreay Site. Therefore, the strategy for the management of low level radioactive wastes at Dounreay represents the BPEO.

6 STAKEHOLDER COMMUNICATION

The Dounreay Stakeholder Group (DSG) was made aware on the 7 November 2012 of the RSA requirement for this review and on the approach identified above. The finalised document shall be copied to the DSG at the same time as it is submitted to SEPA, as part of DSRL's continued stakeholder engagement process.

	Gaseous	Treat by filtration prior to discharge e.g. High Efficiency Particulate in Air (HEPA) filter to remove solids	Treat by filtration prior to discharge e.g. High Efficiency Particulate in Air (HEPA) filter to remove solids	Treat by filtration prior to discharge e.g. High Efficiency Particulate in Air (HEPA) filter to remove solids	Treat by filtration prior to discharge e.g. High Efficiency Particulate in Air (HEPA) filter to remove solids Treat by wet scrubbers to remove volatile activity, electrostatic precipitators, packed beds, condensers and pre-heaters (to prevent condensation in the filters).	Treat by filtration prior to discharge e.g. High Efficiency Particulate in Air (HEPA) filter to remove solids	Treat by filtration prior to discharge e.g. High Efficiency Particulate in Air (HEPA) filter to remove solids	Treat by filtration prior to discharge e.g. High Efficiency Particulate in Air (HEPA) filter to remove solids	Treat by filtration prior to discharge e.g. High Efficiency Particulate in Air (HEPA) filter to remove solids	Treat by filtration prior to discharge e.g. High Efficiency Particulate in Air (HEPA) filter to remove solids	Treat by filtration prior to discharge e.g. High Efficiency Particulate in Air (HEPA) filter to remove solids	Treat by filtration prior to discharge e.g. High Efficiency Particulate in Air (HEPA) filter to remove solids	Treat by filtration prior to discharge e.g. High Efficiency Particulate in Air (HEPA) filter to remove solids	Treat by filtration prior to discharge e.g. High Efficiency Particulate in Air (HEPA) filter to remove solids	Treat by filtration prior to discharge e.g. High Efficiency Particulate in Air (HEPA) filter to remove solids	Treat by filtration prior to discharge e.g. High Efficiency Particulate in Air (HEPA) filter to remove solids

* Special Nuclear Material (SNM) where it is declared to be waste

Appendix 3

Comparison of the Previous BPEOs (pre PBO) to the Current DSRL Waste Management Strategy

Waste Category		Waste Stream	BPEO Treatment Proposal (Pre PBO)	Change from Post PBO	Impact of Change on BPEO	BPEO Treatment Proposal (2013)	Reason for change
RHILW	Solid	Special Nuclear Materials (SNM) *	Sorting, size reduction, immobilisation/ encapsulation for storage and final GDF	Yes	Not Significant	Sorting, size reduction, immobilisation/ encapsulation for storage	Scottish Government HAW Policy – Storage rather than GDF Proposed minor change to use TruShield drums (BPM level change)
		Other Ops and decommissioning wastes	Assay sorting by material, size reduction, volume reduction, immobilisation/ encapsulation for storage and final GDF	Yes	Not Significant	Assay sorting by material, size reduction, volume reduction, immobilisation/ encapsulation for storage	Scottish Government HAW Policy – Storage rather than GDF Proposed minor change to use WAGR boxes, Z6033 drums, TruShield drums, 500 litre drums and 2m boxes for ILW Storage (BPM level change)
		Ion Exchange columns	Immobilisation/ encapsulation for storage and final GDF	Yes	Not Significant	Immobilised in polymer and placed in Tru shields for ILW storage	Scottish Government HAW Policy – Storage rather than GDF Minor change as the immobilisation proposed is no longer cement, but immobilisation is still proposed. (Optimisation issue)
	Liquid	Reprocessing liquors (MTR, DFR, PFR)	Immobilisation/ encapsulation for storage and final GDF	Yes	Not Significant	Immobilisation/ encapsulation for storage	Scottish Government HAW Policy – Storage rather than GDF Previously proposed treatment in D3900 but now treat in modified D2700 (DCP) no change to final waste form.
		SNM *	Pre-treat, immobilisation/ encapsulation for storage and final GDF	Yes	Not Significant	Pre-treat, immobilisation/ encapsulation for storage	Scottish Government HAW Policy – Storage rather than GDF Previously proposed treatment in D3900 but now treat in modified D2700 (DCP) no change to final waste form. Minor change as solvents are washed with both potassium permangante and sodium carbonate, with the solvent being absorbed on to Nochar for LLW disposal.
		Small Volume liquors (TSV)	Immobilisation/ encapsulation for storage and final GDF or Chemical treatment/ IX for marine discharge	No	N/A	Immobilisation/ encapsulation for storage or Chemical treatment/ IX for marine discharge	No Change
		Liquid Metals Na and NaK coolants	Chemical treatment/ IX for marine discharge	No	N/A	Chemical treatment/ IX for marine discharge	No change
	Sludge	ADU Floc	Treatment, immobilisation/ encapsulation for storage and final GDF	Yes	Not Significant	Treatment, immobilisation/ encapsulation for storage	Scottish Government HAW Policy – Storage rather than GDF Previously proposed treatment in D3900 but now treat in modified D2700 (DCP) no change to final waste form.
		Shaft and Silo Sludges	Treatment, immobilisation/ encapsulation for storage and final GDF	Yes	Not Significant	Treatment, immobilisation/ encapsulation for storage	Scottish Government HAW Policy – Storage rather than GDF New plant to replace previously proposed D3200 but no change to final waste form.
CHILW	Solid	SNM *	Sorting, size reduction, immobilisation/ encapsulation for storage and final GDF	Yes	Not Significant	Sorting, size reduction, immobilisation/ encapsulation for storage	Scottish Government HAW Policy – Storage rather than GDF
		PCM	Assay sorting, volume reduction, immobilisation/ encapsulation for storage and final GDF	Yes	Not Significant	Assay sorting, volume reduction, immobilisation/ encapsulation for storage	Scottish Government HAW Policy – Storage rather than GDF
		UCM	Assay sorting, volume reduction, immobilisation/ encapsulation for storage and final GDF	Yes	Not Significant	Assay sorting, volume reduction, immobilisation/ encapsulation for storage	Scottish Government HAW Policy – Storage rather than GDF
		Thorium Contaminated Wastes	Assay sorting, volume reduction, immobilisation/ encapsulation for storage and final GDF	Yes	Not Significant	Assay sorting, volume reduction, immobilisation/ encapsulation for storage and final GDF	Scottish Government HAW Policy – Storage rather than GDF
		Irradiated Graphite	Store Encapsulated pending transfer to GDF	Yes	Not Significant	Store Encapsulated	Scottish Government HAW Policy – Storage rather than GDF The DMTR component is now anticipated to be LLW and fall outwith ILW stream
		Irradiated Graphite	Store Encapsulated pending transfer to GDF	Yes	Not Significant	Store Encapsulated	Scottish Government HAW Policy – Storage rather than GDF **PFR** – The Graphite forms the reactor neutron shield and is held within steel neutron shield rods. Rods in Row 1 (the outer most row) are now anticipated to be LLW and will fall outwith the ILW stream. Rods within 7-5 are the inner most rows and as a result are highly activated RHILW.

Waste Category		Waste Stream	BPEO Treatment Proposal (Pre PBO)	Change from Post PBO	Impact of Change on BPEO	BPEO Treatment Proposal (2013)	Reason for change
		Spoil from under building foot print	Not considered previously	**Yes**	N/A	WAGR boxes, self-shielded container store	Waste stream now considered and proposed to be treated in the manner according to its nature eg, Solid form LLW, ILW.
	Liquid	SNM (Thorium Nitrate) *	Cementation into 500 l drums	Yes	Not Significant	Cementation into 500 l drums	Scottish Government HAW Policy – Storage rather than GDF
		Contaminated solvents and oils from reprocessing)	Wet abatement, incineration, filtration for gaseous and or marine discharge and or Immobilisation/ encapsulation for storage and final GDF	Yes	Not Significant	Wet abatement, incineration, filtration for gaseous and or marine discharge and or Immobilisation/ encapsulation for storage	Scottish Government HAW Policy – Storage rather than GDF
Low Level Waste	**Solid**	Compactable	Compacted via WRACS and placed in HHISOs for LLW Vaults	No	N/A	Compacted via WRACS and placed in HHISOs for LLW Vaults	No change
		Bulk	Immobilise/encapsulate into passively safe for disposal to LLW Vaults	No	N/A	Immobilise/encapsulate into passively safe for disposal to LLW Vaults	No change
		Spoil	Place in 1 tonne bags in HHISO for LLW Vaults	No	N/A	Place in 1 tonne bags in HHISO for LLW Vaults	No change
	Liquid	Effluent for discharge	Conditioning (pH adjustment and filtering) for marine discharge	No	N/A	Conditioning (pH adjustment and filtering) for marine discharge	No change
		Solvents and oils	Wet abatement, incineration, filtration for gaseous and or marine discharge and or Immobilisation/ encapsulation for storage and final LLW disposal	No	N/A	Wet abatement, incineration, filtration for gaseous and or marine discharge and or Immobilisation/ encapsulation for storage and final LLW disposal	No change
	Sludge	Sludge /Granular media	Immobilisation/ encapsulation for disposal as solid LLW	No	N/A	Immobilisation/ encapsulation for disposal as solid LLW	No change
		LSA Scale	Assay, Store, treat and disposal as CHILW solids	No	N/A	Store, assay, treat and store as CHILW solids	Scottish Government HAW Policy – Storage rather than GDF
		Putrescible Waste	Dry, assay, store treatment and immobilisation/ encapsulation for disposal as solid LLW	No	Not Significant	Dry, assay, store treatment and immobilisation/ encapsulation for disposal as solid OoSoR – Controlled Waste	Characterisation has allowed this waste to fall out with RSA disposal
HVLA/ Demolition Waste	**Solid**	Construction and demolition wastes/spoil	Place in 1 tonne bags in HHISO for LLW Vaults	Yes	Not Significant	Place in bags in Demolition LLW Vaults	Size of bags will be optimised. Expected to be 1 tonnes or larger.
Controlled Non Hazardous Waste	**Solid**	Construction and demolition wastes/spoil	Re-use /recycle /disposal to landfill	No	N/A	Re-use /recycle /disposal to landfill	No change
		Soil	Re-use /recycle /disposal to landfill	No	N/A	Re-use /recycle /disposal to landfill	No change
		Recyclable materials	Re-use/ recycle	No	N/A	Re-use/ recycle	No change
		Non recyclable materials	Dispose to landfill	No	N/A	Dispose to landfill	No change
	Liquid	Recyclable	Re-use recycle	No	N/A	Re-use recycle	No change
		Non recyclable	Transfer to Specialist contractor	No	N/A	Transfer to Specialist contractor	No change
Controlled Inert Waste	**Solid**	Construction and demolition wastes/spoil	Re-use /recycle /disposal to landfill	No	N/A	Re-use /recycle /disposal to landfill	No change
		Soil	Re-use /recycle /disposal to landfill	No	N/A	Re-use /recycle /disposal to landfill	No change
		Recyclable materials	Re-use recycle	No	N/A	Re-use recycle	No change
		Non recyclable materials	Dispose to landfill	No	N/A	Dispose to landfill	No change
Inert Waste	**Liquid**	Recyclable	Re-use recycle	No	N/A	Re-use recycle	No change

Waste Category		Waste Stream	BPEO Treatment Proposal (Pre PBO)	Change from Post PBO	Impact of Change on BPEO	BPEO Treatment Proposal (2013)	Reason for change
		Non recyclable	Transfer to Specialist contractor	No	N/A	Transfer to Specialist contractor	No change
Controlled Hazardous Waste	Solid	Construction and demolition wastes/spoil	Treatment of chemically contaminated materials/ specialist contractor for reuse recycle or disposal	No	N/A	Treatment of chemically contaminated materials/ specialist contractor for reuse recycle or disposal	No change
		Soil	Treatment of chemically contaminated materials/ specialist contractor for reuse recycle or disposal	No	N/A	Treatment of chemically contaminated materials/ specialist contractor for reuse recycle or disposal	No change
		Recyclable materials	Specialist contractor for reuse recycle	No	N/A	Specialist contractor for reuse recycle	No change
		Non recyclable materials	Specialist contractor for disposal to landfill	No	N/A	Specialist contractor for disposal to landfill	No change
	Liquid	Recyclable	Re-use recycle or specialist contractor	No	N/A	Re-use recycle or specialist contractor	No change
		Non recyclable	Specialist contractor for disposal	No	N/A	Specialist contractor for disposal	No change
	Sludge	Milliscreen Putrescible Waste	Treatment if required and off site disposal	No	N/A	Treatment if required and off site disposal	No change
		Package Sewage Treatment Plant Sludge	New waste stream due to improved sewage treatment	No	N/A	Treatment if required and off site disposal	Waste stream now considered and proposed to be treated in the manner according to its nature eg, Controlled Waste
Gaseous	Gas	Routine Gaseous Discharges	Filtration and discharge to atmosphere	No	N/A	Filtration and discharge to atmosphere	No change

* Special Nuclear Material (SNM) where it is declared to be waste
